Small Instrumentation Modules

SIM914 — 350 MHz preamplifier (2-channel)

- DC to 350 MHz bandwidth
- Two independent amplifier channels
- Voltage gain of 5 (14 dB) per channel
- 6.4 nV/ \sqrt{Hz} input noise
- 3 ns overload recovery
- Excellent phase linearity

• SIM914 \$975 (U.S. list)

— SIM914 Dual 350 MHz Preamplifier -

The SIM914 350 MHz preamplifier contains two widebandwidth, DC-coupled amplifiers, each with a gain of 5 (14 dB). Its fast rise time, low noise, and excellent DC accuracy make it an ideal instrument for amplifying signals like those from photomultiplier tubes and photodiodes.

The gain stages of several SIM914 can be cascaded without creating oscillation problems. Input clamping gives a 3 ns recovery time from a $10\times$ overload.

Wide bandwidth, along with 50 Ω input and output impedance, ensures a linear phase response across the entire frequency range, preserving pulse shapes.
