Calibration types	
CalReady, 1-port	Each FieldFox has a highly accurate calibration at the test port, at room temperature, traceable to national standards labs.
QuickCal, 1-port	Uses internal and a subset of external standards. Optimum error correction with Type-N and 7/16 connectors, and up to 18 GHz.
SOL, 1-port	Traditional short, open and load 1-port calibration for reflection measurements.
Frequency response	Simultaneous magnitude and phase correction of frequency response errors for either reflection or transmission measurements.
Enhanced response (also known as one-path, two-port)	Corrects for frequency response and source match for transmission measurements, and reflection frequency response, directivity and source match for reflection measurements. Partial correction for load match for low-loss reciprocal devices.
CalReady, 2-port	Full 12-term error correction at test port, at room temperature. Highly accurate calibration, traceable to national standards labs.
QuickCal, 2-port	Full 12-term error correction using internal and a subset of external standards. Optimum error correction with Type-N and 7/16 connectors, and up to 18 GHz.
SOLT or offset short, 2-port	Traditional short, open, load and thru (or using offset short standards) for calibration. Full 12-term error correction.
QSOLT calibration, 2-port	Full 12-term error correction. Requires fewer connections, compared to traditional SOLT (4 compared to 7). Applicable to insertable devices.
Unknown thru calibration, 2-port	Full 12-term error correction. Applicable to both insertable and non-insertable devices. Easily characterize non-insertable devices such as Type-N to 3.5 mm, or female-female devices with unknown thru calibration.
Guided calibration wizard	FieldFox's calibration wizard recommends a calibration type and calibration kit based on selected parameters and connector types. Alternatively, users can select their own calibration type and calibration kit.
Interpolated error correction	With any type of accuracy enhancement applied, interpolated mode recalculates the error coefficients when the test frequencies are changed. The number of points can be increased or decreased and the start/stop frequencies can be changed, but the resulting frequency span must be a subset of the original calibration frequency span.

Time domain, Option 010

The performance listed in this section applies to the time domain capabilities available in the following models:

FieldFox microwave combination analyzers: **N9913A, N9914A, N9915A, N9916A, N9917A, N9918A**

FieldFox microwave vector network analyzers: **N9925A, N9926A, N9927A, N9928A**

In time-domain mode, FieldFox computes the inverse Fourier transform of the frequency-domain data to display reflection or transmission coefficients versus time.

Setup parameters

- Time: start, stop, center, span
- Gating: start, stop, center, span, and on/off
- Number of points, velocity factor, line loss, window shape, independent control for all four traces

Time stimulus modes

Low-pass step	Low-pass step is similar to a traditional time domain reflectometer (TDR) stimulus waveform. It is used to measure low-pass devices. The frequency-domain data should extend from DC (extrapolated value) to a higher value.
Low-pass impulse	Low-pass impulse response is used to measure low-pass devices.
Bandpass impulse	The bandpass impulse simulates a pulsed RF signal and is used to measure the time domain response of band-limited devices.

Windows

The windowing function can be used to filter the frequency domain data and thereby reduce overshoot and ringing in the time domain response.

Windows	Minimum, medium and maximum, manual entry of Kaiser Beta and impulse width.
---------	---

Gating

The gating function can be used to selectively remove reflection or transmission time domain responses. In converting back to the frequency domain the effects of the responses outside the gate are removed. The results can be viewed with gating on and off, using two traces.

Gate types	Notch, bandpass
Gate shapes	Maximum, wide, normal, minimum

Vector voltmeter (VVM), Option 308

The performance listed in this section applies to the VVM mode capabilities available in the following models:

FieldFox microwave combination analyzers: **N9913A, N9914A, N9915A, N9916A, N9917A, N9918A**

FieldFox microwave vector network analyzers: **N9925A, N9926A, N9927A, N9928A**

With vector voltmeter mode, you can characterize the difference between two measurements easily. The zeroing function allows you to create a reference signal, and characterize the difference between two device measurements. The results are shown on a large display in digital format.
